How the Brain's Wiring Makes Us Who We Are - Sebastian Seung

This network of connections has been called the "connectome" by scientists. To map it is essentially to build the brain's wiring diagram. The human brain connectome has not yet been fully mapped at the cellular or the macro (high-level structural and functional) scale,...

Connectome: How the Brain's Wiring Makes Us Who We Are

The connectome theory is also less deterministic. There is reason to believe that we shape our own connectomes by the actions we take, even by the things we think. Brain wiring may make us who we are, but we play an important role in wiring up our brains. To restate the theory more simply: You are more than your genes.

Cartographers of the Brain: Mapping the Connectome

A connectome contains one's memories and personality, and defines who we are. The idea is that at birth, one's neurons are connected with each another at random. As one grows, the brain's connectome changes through the "four R's": reweighting, reconnection, rewiring, and regeneration. These changes are the essence of growing new memories.

Can we build a complete wiring diagram of the human brain?

The four R's. The brain is naturally endowed with four mechanisms of connectome change: Reweighting means changes in the strengths of synapses. Reconnection is the creation and elimination of synapses. Rewiring is the creation and elimination of neural branches. Regeneration is the creation and elimination of neurons.
