The main objective of the paper is the development and evaluation of a multi-mode pushover procedure for the approximate analysis of the seismic response of steel moment-resisting frames. A generalized force vector derived from modal combination simulates the instantaneous force distribution acting on the structure when the interstorey drift reaches its maximum value during dynamic response to ...

Pushover analysis is based on the assumption that structures oscillate predominantly in the first mode or in the lower modes of vibration during a seismic event. This leads to a reduction of the multi-degree-of-freedom, MDOF system, to an equivalent single-degree-of-freedom, ESDOF system, with properties ...

Seismic analysis is a subset of structural analysis and is the calculation of the response of a building (or nonbuilding) structure to earthquakes.It is part of the process of structural design, earthquake engineering or structural assessment and retrofit (see structural engineering) in regions where earthquakes are prevalent.. As seen in the figure, a building has the potential to 'wave' back ...

The so-called multi directional pushover analysis (MDPA) is applied to a very complex building, the Palacio Pereira located in Santiago de Chile. This historical masonry building presents structural irregularity both in plan and in elevation, and exhibited structural deficiencies (flexible timber floors, inadequate floor-to-wall and wall-to-wall connections) when it was struck by 2010 Chile ...
